Postdoctoral Positions in Metabolic Engineering of Photosynthetic Microbes
Jamey Young’s Lab at Vanderbilt University

Two postdoctoral positions are available immediately to develop and test novel strategies for engineering photosynthetic microbes (cyanobacteria, algae, diatoms) for production of fuel and chemical compounds. $^{13}$C metabolic flux analysis, targeted metabolomics profiling, algal cell culture, biochemical assays, and molecular biology studies will be key approaches used in the research. Motivation and experience will be important factors in the recruitment process. For more information about the Young laboratory, see our website: http://www.vanderbilt.edu/younglab. Interested applicants should send a current CV including the names of three references to: Dr. Jamey Young at: j.d.young@vanderbilt.edu.
